                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                            AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; outnerary; antiporiatic; antiporiatic; neuroprotective; coteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coaquiant; vasotropic; antidabetic; hypotensive; dermaclogical; immunosuppressant; cartidabetic; hypotensive; dermaclogical; immunosuppressive; antidabetic; hypotensive; dermaclogical; immunosuppressive; antidabetic; hypotensive; dermaclogical; immunosuppressive; antidabetic; hypotensive; dermaclogical; immunosuppressive; cartidabetic; hypotensive; dermaclogical; immunosuppressive; antidabetic; hypotensive; dermaclogical; immunosuppressive; antidabetic; hypotensive; dermaclogical conditions associated with an ORFX-associated disorder. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, cordinate disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic cordinate disease; cardiovascular disease; disorders, astenma, bacterial or fungal infection, malaria, autoinmune disorders, astenma, allergies, aplastic anemia, burns, wounds, bone and cartilage damage, cocural haemoglobinuria, antidiamatory disease; to enhance contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ADAMTS-N; disintegrin; metalloprotease; thrombospondin type I motif; tumour cachexia; inflammation; dermatosparaxis; EDS-VIIC; angiogenesis; Ehlers-Danlos syndrome type VIIC; articular cartilage erosion; human; metastasis; embryogenesis; egg implantation; chromosome 15; ADAMTS-7.

This invention relates to murine and human ADAWTS-N (A disintegrin-like and metalloprocease domain with thrombospondin type I motifs) proteins, designated ADAWTS-S, 6, 7, 8, 9, 10 and Rl. Also included in the cinvention are cDNA sequences encoding the proteins, and antibodies specific for the proteins. The nucleic acid sequences and proteins may be used in the prevention, disgnosis and treatment of diseases associated with inappropriate ADAMTS-N expression. Disorders that may be treated using the nucleic acids, proteins and antibodies include, for example tumour cachexia, inflammation, dermatosparaxis in cattle or Enters-Danlos syndrome type VIC (EDS-VIC) in humans, erosion of articular cartilage in arthitic (both inflammatory and non-inflammatory) disease.

Controlling embryogenesis and implantation of fertilised eggs. The correct present sequence represents human ADAWTS-7 gene is

                                                                                                                          The present sequence represents a disintegrin and metalloprotease (ADAM) type metal protease designated MDTS1, isolated from human. MDTS proteins have cytostatic and antiarthritic activities. They can be used as a drug for cancers, arthritis and arthrosis deformans.

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatoropic; vulnerary; cartiporiatic; antiparkinsonian; mootropic; neuroprotective; cartiporiatic; anticonvulsant; antiarthitic; immunosuppressant; cartiabetic; hypotenative; dermarological; immunosuppressant; antithiamatory; antibacterial; antiviral; antifungal; antitheumatic; antidinflammatory; antibacterial; antiviral; antifungal; antitheumatic; antithiamatory; antibacterial; antiviral; antifungal; antitheumatic; cantinflammatory; antibacterial; antiviral; antichingal; antithreumatic; antithiamatory; antibacterial; antiviral; antifungal; antitheumatic; cantinflammatory; antibacterial; antiviral; antifungal; antitheumatic; cantionic acids can be used for predisposition to, or preventing or treating conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, contained associated disorders, neuroacterial; antions disorders, neuroacterial; antimingal expression; hypothyroidism, cholesterol ester storage, systemic lupus cythematosus, severe combined immunodeficiency (SCID), AIDS, viral, conternal or fungal infection, malaria, autoimmune disorders asthmac, allergies, aplactic anaemia, burns, wounds, bone and cartilage damage, coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; protease; PCR primer; cytostatic; immunomodulator; cardiant; vasotropic; antimigraine; analgesic; endocrine; nootropic; tranquiliser; hypertensive; hypotensive; neuropetective; anabolic; and analocric; antimiflammatory; aspartyl protease; cysteine protease; endocretic; breast; colon; lung; prostrate; cervical; brain; ovarian; bladder; kidney; pain; immune-related disease; cardiovascular disease; neuronal disease; migraine; sexual dysfunction; mood disorder; attention disorder; dyskinesia; metabolic disorder; inflammatory disorder;

The invention relates to an isolated, enriched, or purified protease polypeptide (1) and polynucleotide (11) encoding (1). (1) may be used to screen for substances (5) that may modulate its activity. Administering (1) shich modulates protease activity in vitro) may be used to treat a disease or disorder selected from cancers (e.g., of tissues, of blood or hammacopoietic origin, of the breast, colon, lung, prostrate, cervical, brain, ovarian, bladder or kidney), immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases (e.g., central or peripheral nervous system diseases, migrafine, pain, escual dysfunction, mood disorders, attention disorders, neurological disorders and substances of the color of the disorders and inflammatory disorders and substances also be useful as a disponsite tool for a disease or disorder such as those above. Adul 2816. Protease amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Pravia C.A., Boncempl E.;

"A novel ubiquitin-conjugating enzyme of trypanosoma cruzi.";

Submitted (JUL-2000) to the EMBL/GenBank/DDBJ databases.

-I. FUNCTION: CATALYZES THE COVALENT ATTACHMENT OF UBIQUITIN TO OTHER

PROTEINS (BY SIMILARITY).

-I. CATALYIC ACTIVITY: ATP + UBIQUITIN + PROTEIN LYSINE = AMP +

DIPHOSPHATE + PROTEIN N-UBIQUITYLLYSINE.

-I. PATHWAY: SECOND STEP IN UBIQUITIN CONJUGATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Trypanosoma cruzi.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                  The invention relates to an isolated or substantially pure Von Willebrand factor-cleaving procease (vWF-cp) polypeptide. vWF-cp is useful for purifying vWF which involves providing vWF-cp as a ligand, contacting a solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified where vWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunising an animal with vWF-cp and isolating the anti-vWF cp polypeptide antibodies from the animal. vWF-cp is useful for twe vWF cp polypeptide antibodies from the animal. vWF-cp is useful for thromboembolic disease such as thrombotic thrombocytopaenia or thromboembolic disease such as thrombotic thrombocytopaenia or heamolytic-uraemic syndrome. vWF-cp can also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which construction expression systems and generating transgenic animals which construction expression systems and generating transgenic animals which
                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            enzyme;

factor cleaving protease (vWF-cp) polypeptide a ligand, contacting a purifying vWF which involves providing vWF-cp as a ligand, contacting a golutifying vWF which involves providing vWF-cp as a ligand, contacting a solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified vWF. vWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunising an animal with vWF-cp and isolating the anti-conference of polypeptide antibodies from the animal. vWF-cp is useful for vWF cp polypeptide antibodies from the animal. vWF-cp is useful for confering a preparation of prophylaxis and therapy of thromboens and thromboens of thromboens and thromboens of thromboens and thromboens of thromboens of thromboens of thromboens of thromboens of thromboens of thromboens of thromboens of the syndrome. VWF-cp can also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which the present sequence is human vWF-cp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                            invention relates to an isolated or substantially pure Von Willebrand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, Von Willebrand factor-cleaving protease, vWF-cp; therapy, enzyme; transgenic animal; immunisation; thromboembolic disease; preeclampsia; thrombotic thrombocytic purpura; TTP; Henoch-Schonlein purpura; thrombosis; neonatal thrombocytopaenia; haemolytic-uraemic syndrome; transgenic; anticoagulant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated or substantially purified von Willebrand factor-cleaving procease, useful for producing preparation for therapy of thrombosis and thromboembolic disease such as thrombotic thrombocytic purpura
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human Von Willebrand factor-cleaving protease N-terminal peptide #5.
protease, useful for producing preparation for therapy of thrombosi
and thromboembolic disease such as thrombotic thrombocytic purpura

            The invention relates to an isolated or substantially pure yon Willebrand factor-cleaving protesse (vWF-cp) polypeptide. vWF-cp is useful for purifying vWF which involves providing vWF-cp as a ligand, contacting a solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified vWF. vWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunising an animal with vWF-cp and isolating the anti-vWF cp polypeptide antibodies from the animal. vWF-cp is useful for producing a preparation of prophylaxis and therapy of thrombosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated or substantially pure Von Willebrand factor-cleaving protease (vWF-cp) polypeptide. vWF-cp is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, Von Willebrand factor-cleaving protease, VWF-cp, therapy, enzyme, transgent animal; immunisation; thromboembolio disease, precolampsia, thromboent chromboetic thromboeytic purpura, TPP, Henoch-Schonlein purpura, thromboetic thromboetic thromboetic thromboetic thromboetic thromboetic thromboetic syndrome;
                                                                                                                                                                                              thromboembolic disease such as thrombotic thrombocytic purpura (TTP), Henoch-Schonlain purpura, precelampaia, neonatal thrombocytopsenia or haemolytic-uraemic syndrome. WHF-cp can also be used for processing plasmatic or recombinantly produced WMF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human VMF-cp N-terminal peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel isolated or substantially purified Von Willebrand factor-cleaving protease, useful for producing preparation for therapy of thrombosis and thromboembolic disease such as thrombotic thrombocytic purpura -

purifying wWF which involves providing vWF-cp as a ligand, contacting a solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified vWF. vWF-cp is useful for an animal with vWF-cp and isolating the antibodies which involves immunising an animal with vWF-cp and isolating the antiproducing a preparation of prophylaxis and therapy of thrombosis and thromboembolic disease such as thrombocut thrombocytic purpura (TTP), Henoch-Schonlein purpura, preeclampsia, neonatal thrombocytopaenia or haemolyvic-uraemic syndrome. vWF-cp can also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human vWF-cp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; zdints; anti-angiogenic; intestinal polypeptide; wound healing; extracellular matrix interaction; tumour suppression; gamete maturation; immunologic recognition; gastrointestinal irradiation; chemotherapy; proteolysis; apoptosis; angiogenesis; infection; cell adhesion; cell fusion; cell signalling; tumour; Crohn's disease; melanoma; trauma; inflammatory bowel disease; food poisoning; degenerative disease; inflammation; fertility; gamete maturation; epithelial disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New anti-angiogenic integrinal polypeptides, zdints polypeptides, which are members-of-disintegrin processes, for modulating extracellular matrix interaction, tumour suppression and wound healing
                                                                                                                                                                                                                                                                                                                                                                 Gaps

                     The present sequence represents a human zdint5 polypeptide. The zdint5 polypeptide is an anti-angiogenic intestinal polypeptide. Zdint5 is used for modulating extracellular matrix interactions. Zdint5 is useful as a tool for identifying new family members of polypeptides is useful as a tool for identifying new family members of polypeptides. Zdint5 polypeptides are to clone 5' non-coding regions of zdint5 gene. Zdint5 polypeptides are to clone 5' non-coding regions of zdint5 gene. Zdint5 polypeptides are and growth and differentiation either working in isolation or in and growth and differentiation either working in isolation or in conjunction with other molecules in colon, small intestine, fetal lung, testis and B-cells. Zdint5 polypeptides are also useful for promoting wound healing, in the treatment of disorders associated with recovery after gastrointestinal irradiation, chemotherapy or antibody use, as an extraorellular matrix repair and remodeling. The polypeptides are also useful for medulating proteolysis, apoptosis, angiogenesis, infection, cell adhesion, cell fusion and signalling. The polypeptides are also useful for treating tumour formation, Crohn's disease, inflammatory bowel disease, food poisoning, melanoma, cell fusion, inflammation, immunology, trauma and epithelial

the aggrecanase-mediated cleavage of aggrecan in cartilage. The protein of the invention is useful for developing inhibitors of aggrecanase protein. The cDNA sequence encoding the aggrecanase protein of the invention is useful for designing probes for obtaining DNA containing aggrecanase for obtaining DNA sequences encoding other aggrecanase molecules. The cDNA sequence is also useful for detecting mRNA encoding aggrecanase in a given cell compulation, and thus for detecting or disgnosting genetic disorders involving the aggrecanase, or disorders involving cellular, organ or cinvolving the aggrecanase is irregularly transcribed or expressed. The DNA sequences may also be useful for preparing vectors for gene therapy applications. An inhibitor of the protein is useful cartilage, by blocking the enzyme's proteolytic activity. An cartilage, by blocking the enzyme's proteolytic activity. An aggrecanase protein is useful care useful for treating various aggrecanase-associated conditions charevel and method for inhibition of its activity are useful for treating various aggrecanase-associated conditions including osteoarthritis and other inflammatory diseases. The containing of the formal aggrecanase protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                         ö
polynucleotide encoding it. The protein of the invention is useful for treating cardiovascular disorders including diseases of the heart and vascular system, such as congestive heart failure, myocardial infarction, isohaemic heart diseases (e.g., stable angina, unstable angina), arrivation, cancernal and ventricular arrhythmia, hypertension), and periphran vascular kinds of eccondary arterial hypertension), and periphran vascular diseases (e.g., chronic periphran arterial occlusive disease, acute arterial thrombosis and embolism, inflammatory vascular disorders, etc), liver disorders and embolism, inflammatory vascular disorders, etc), liver disorders and embolism, inflammatory vascular disorders, etc), liver disorders and embolism, inflammatory vascular disorders, etc), must useful in disgnostic assays for detecting diseases and abnormalities of mutations in the nucleic acid sequences which encode the presence of mutations in the nucleic acid sequences which encode the protein. The sequences are also useful for modulating ADAM-TS-like protein activity in addisease condition. This sequence represents the human ADAM-TS-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  extracellular matrix interaction; tumour suppression; gamete maturation; immunologic recognition; gastrointestinal irradiation; chemotherapy; proteolysis; apoptosis; angiogenesis; infection; cell adhesion; cell fusion; cell signalling; tumour; Crohn's disease; melanoma; trauma; inflammatory bowel disease; food poisoning; degenerative disease; inflammatory, fertility; gamete maturation; epithelial disorder.

The present sequence represents a human zdint5 polypeptide. The zdint5 to polypeptide is an anti-angiogenic intestinal polypeptide. Zdint5 is used for modulating extracellular matrix interactions. Zdint5 is useful as a tool for identifying new family members of polypeptides. Zdint5 polymucleotides are useful as probes or primers of polypeptides. Zdint5 polymucleotides are used for tumour suppression of zdint5 gene. Zdint5 polypeptides are confunction with other molecules in colon, small intestine, fetal lung, cestis and B-cells. Zdint5 polypeptides are also useful for promoting wound healing, in the treatment of disorders associated with recovery after gastrointestinal irradiation, chemotherapy or antibody use, after gastrointestinal irradiation, chemotherapy or antibody use, and extracellular matrix repair and remodeling. The polypeptides are also useful for modulating proteolysis, apoptosis, angiogenesis, infection, cell adhesion, cell fusion and signalling. The polypeptides are also useful for treating tumour formation, Crohn's disease, inflammatory bowel disease, food poisoning, melanoma, cell fusion, degenerative diseases, disorders related to immunity, inflammation, immunology, trauma and epithelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; Von Willebrand factor-cleaving protease; vWF-cp; therapy; enzyme; transgentC animaly...tmnuntsation;—thromboembolic disease; preeclampsia; thrombocit chrombocytic purpura; TTP; Henoch-Schonlein purpura; thrombosis; neonatal thrombocytopaenia; haemolytic-uraemic syndrome; transgenic; anticoagulant.
                                                                                                                                                                       New anti-angiogenic intestinal polypeptides, zdint5 polypeptides, which are members of disintegrin protesses, for modulating extracellular matrix interaction, tumour suppression and wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                               The invention relates to an isolated or substantially pure Von Willebrand factor-cleaving protease (vWF-cp) polypeptide. vWF-cp is useful for purifying vW which involves providing vWF-cp as a ligand, contacting a colution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified vWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunising an animal with vWF-cp and isolating the anti-vWF cp prolypeptide antibodies from the animal. vWF-cp is useful for vMF cp propagation of prophylaxis and therapy of thromboeis and thromboembolic disease such as thrombotic thrombocytic purpura (TTP), Henoch-Schonlein purpura, preeclampsia, neonatal thrombocytopaenia or hamonlytic-uraemic syndrome. vWF-cp can also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human vWF-cp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Osteoarthritis; rheumatoid arthritis; inflammatory bowel disease; Crohn's disease; asthma; Alzheimer's disease; organ transplant rejection; cachexia; allergy; cancer; leukaemia; lymphoma; osteoporosis; etherosclerosis; congestive heart failure; myocardial infarction; stroke; neurodegenerative disease; autoimmune disorder; Huntington's; troke; abarkinson's; migraine; pain; depession; multiple sclerosis; burn; infertility; diabetic shock; gene therapy; ADAMTS-M; A Disintegrin And Metalloprotease; thrombospondin domain.

The present sequence represents a ADAMTS protein, designated ADAMTS-M, that exhibits the characteristics of the ADAM (A Disintegrin And Metalloprotease) family of metalloproteases, and contains a thrombospondin domain (TS). The protein is encoded by the CDNA given in the specification describes a newly isolated polynucleotide, comprising a nucleotide sequence encoding an ADAMTS-M polynucleotide as prodomain in the specification, or a metalloproteinase, disintegrin domain, prodomain or its thrombospondin submocif. The polynucleotide, polypeptide and agent are useful for mendecturing a medicament for treating a subject in need of altering activity or expression of ADAMTS-M. The polynucleotide ADAMTS-M polypeptide and agent are useful for manufacturing a medicament for treating arthritis not recurrent and adent and alterate original cordination, asthma. Alzheimer's disease, organ transplant coxicity and rejection, cachexia, allergy, cancer (e.g. solid tumour cancer including colon, breast, lung, prostate, brain or haematopoietic malignancies including conserve heart failure, myocardial infarction, stroke, head trauma, spinal cord injury, neurodegenerative disease, autoimmune disorders, thuntington's disease, Parkinson's disease, autoimmune disorders, multiple sclerosis, abnormal wound healing, burns, infertility or diabetic shock. The polynucleotide and polypeptide are also useful for in gene therapy for treating the disease cited above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide, useful in gene therapy, particularly for treating or preventing e.g. arthritis, Crohn's disease, Alzheimer's disease and organ transplant toxicity and rejection, comprises ADAMTS polynucleotide and encoded polypeptide -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

purifying vWF which involves providing vWF-cp is useful for solutifying vWF which involves providing vWF-cp as a ligand, contacting a solutifying vWF which involves providing vWF-cp as a ligand, contacting a solution comprising vWF wWF the bound to the ligand and recovering from the ligand purified where vWF is bound to the ligand and recovering from the ligand purified vWF. vWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunisaing an animal with vWF-cp and isolating the anti-vWF cp polypeptide antibodies from the animal. vWF-cp is useful for producing a preparation of prophylaxis and therapy of thrombosis and thench-Schonlein purpura, predict thrombocitic produced and the produced vWF. The invention is useful for has another produced vWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human vWF-cp protein. vWF-cp gene is located on chromosome 9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated or substantially pure von Willebrand factor-cleaving protease (vWF-cp) polypaptide. vWF-cp is useful for purifying wWF which involves providing vWF-cp as a ligand, contacting a solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; Von Willebrand factor-cleaving proteage; vWF-cp; therapy; enzyme; transgenic animal; immunisation; thromboembolic diseage; preeclampsia; thrombotic thrombocytic purpura; TTP; Henoch-Schonlein purpura; thrombosia; neonatal thrombocytopaenia; haemolytic-uraemic syndrome; transgenic; anticoagulant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated or substantially purified Von Willebrand factor-cleaving protease, useful for producing preparation for therapy of thrombosis and thromboembolic disease such as thrombotic thrombocytic purpura
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human Von Willebrand factor-cleaving protease N-terminal peptide #4.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy rechniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                                       ö
whre, wwp.cp is useful for producing anti-wWF cp polypeptide antibodies which involves immunising an animal with vWF-cp and isolating the anti-wWF cp polypeptide antibodies from the animal. vWF-cp is useful for producing a preparation of prophylaxis and therapy of thrombosis and thromboenbolic disease such as thrombocitic thrombocytic purpura (TTP). Henoch-Schonlein purpura, preclampsia, neonatal thrombocycopaenia or haemolytic-uraemic syndrome. vWF-cp can also be used for processing plasmatic or recombinantly produced vWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human vWF-cp N-terminal peptide.
                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                               ö
The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397,

which represent the human ORFX open reading frames 1 to 3161. The ORFX acquences have activities such as: cytostatic; hepatotropic; vulnerary; antiposoriatic; antipostatic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunosuppressant; immunosuppressant; immunosuppressant; immunosuppressant; antidabetic; hypotenarve; dermarcological; immunosuppressure; antidabetic; hypotenarve; dermarcological; immunosuppressure; antithyoid; and antiansemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoparthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus severe combined immunodeficiency (SCID), AIDS, viral, allergies, aplastic anemia, burns, wounds, bone and cartilage damage, concentral hemoglobinuria, antiinflammatory disease, to enhance

and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving contributions in a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical cinaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders or other traits to assess biodiversity responsible for genetic disorders or other traits to assess biodiversity and to produce other types of dasorders or other traits of assess biodiversity and caid sequences. AsG00010-AsG30177 represent novel human dispensite amino acid sequences of the invention.

Concern the sequence data for this patent did not appear in the printed specification, but was obtained in alectronic format directly from WIPO cat fire. The wipo int/pub/published_pot_sequences.

hypochetical protein C41A3.1 - Caenorhabditis elegans
hypochetical protein C41A3.1 - Caenorhabditis elegans
C;Species: Caenorhabditis elegans
C;Species: 20-Sep-1999 #sequence\_revision 20-Sep-1999 #text\_change 01-Dec-2000
C;Accession: T15789
R;Bentley, D.
R;Bentley, D.
Squbmitted to the EMBL Data Library, November 1995
A;Pescription: The sequence of C. elegans cosmid C41A3.

Biol. Chem. 275:4906-4911(2000).

-1- FUNCTION: Non-ribosomal peptide synthetase, able to activate proline and AEO (2-amino-9,10-epoxi-8-oxodecanoic acid), and epimerize L-Pro. Catalyzes the production of HC-toxin: a cyclic tetrapeptide: Activates and thioesterifies L-Pro, and epimerizes it to D-Pro; also uses D-Ala as a substrate but this is epimerized from L-Ala by TOXG.

-1- COFACTOR: CONTAINS 4 COVALENTLY BOUND PHOSPHOPANTETHEINES.
-1- PATHWAY: NON-RIBOSOWAL BIOSYNTHESIS OF HC-TOXIN.
                                                                                                                             SEQUENCE FROM N.A., AND PARTIAL SEQUENCE.

DEPOLARIZATION OF T-TUBULES.

--- SUBBUNT: HOWOTETRAMER (POTENTIAL).

--- MISCELLANEOUS: The calcium release channel is modulated by calcium ions, magnesium ions, ATP and calmodulin.

--- MISCELLANEOUS: The calcium release channel activity resides in the C-terminal region while the remaining part of the protein constitutes the 'foot' structure againing the junctional gap between the SR and the T-tubule. It is possible that the foot structure interacts with the cytoplasmic region of the dihydropyridine receptor.

--- MISCELLANEOUS: Ryanodine is an alkaloid that binds to the Calminatory and interional SR and modulates its activity.

--- SIMILARITY: CONTAINS 3 SPRY DOWAINS.

Tyrocidine synthetaes III Includes: ATP-dependent asparagine
adenylase (AsnA) (Asparagine activase); ATP-dependent tyrosine
adenylase (TyrA) (Tyrosine activase); ATP-dependent valine adenylase
(Vall) (Valine activase); ATP-dependent ornithine adenylase (OrnA)
(Ornithine activase); ATP-dependent leucine adenylase (Leucine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (OPTIONAL)

-INSCELLANEOUS: TYROCIDINE IS A MIXTURE OF FOUR CYCLLC
DECAPEPTIDES, TYROCIDINE A (D-PHE-PRO-PHE-D-PHE-ASN-GLN-TYR-VAL-ORN-LEU), B, C, AND D, IN WHICH PHE, AT POSITIONS 3, 4, AND TYR RESIDUES ARE GRADUALLY REPLACED BY TRP, DEPENDING ON THE RELATIVE CONCENTRATIONS OF THESE AMINO ACIDS IN THE GROWTH MEDIUM.
-!- SIMILARITY: BELONGS TO THE ATP-DEPENDENT AMP-BINDING ENZYME
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -:- COFACTOR: CONTAINS 6 COVALENTLY BOUND PHOSPHOPANTETHEINES (BY SIMILARITY)
-:- PATHWAY: CYCLIA peptide antibiotic tyrocidine biosynthesis
-:- SUBUNIT: LARGE MULTIENZYME COMPLEX OF TYCA, TYCB AND TYCC.
-:- DOWAIN: CONSISTS OF SIX MODULES, AND HARBORS A PUTATIVE
--- THIOESTERASE DOMAIN AT ITS C-TERMINAL END. BACH MODULE
INCORPORATES ONE AMINO ACID INTO THE PEPTIDE PRODUCT AND CAN BE FURTHER SUBDIVIDED INTO DOMAINS RESPONSIBLE FOR SUBSTRATE
ADENYLATION, THIOLATION, CONDENSATION (NOT FOR THE INITATION MODULE), AND EPIMERIZATION (OPTIONAL), AND N METHYLATION (OPTIONAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             STRAIN=ATCC 8185;

MOOTZ H.D., Marahiel M.A.;
"The tyrocidine biosynthesis operon of Bacillus brevis: Complete nucleocide sequence and biochemical characterization of functional internal adenylation domains "; J. Bacteriol. 179:6843-6850(1997).
-!- FUNCTION: INCORPORATES SIX AMINO ACIDS (FOR TYROCIDINE A, ASN, GLN, TYR, VAL, ORN, AND LEU) IN THEIR L-CONFIGURATION INTO THE PRODUCT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacteria, Firmicutes, Bacillales, Paenibacillaceae, Brevibacillus.
